Final Project Briefing Document

Project Outline

As a team, create a blog website written in Python that uses the Flask Framework. The website should function well on multiple different devices (desktop / tablet / phone).

Technical Specifications

Demonstrate what you have learnt throughout the program, including:

- Extensive use of the Python language
- Strict and consistent coding standards
- Appropriate use of object-oriented programming
- Structured exception handling
- Database design skills
- Use GIT / GitHub for version control
- HTML, CSS and JavaScript

Project Specifications

Throughout this project your team should utilise Agile practices. You should assign a Scrum Master for the duration of the project and plan the number and duration of your sprints. You must conduct rituals such as stand-ups, reviews and retrospectives.

Throughout the project you will showcase your weekly progress to your instructor during your 30-minute hangout sessions. You will discuss the outcomes of your reviews and retrospectives with your instructor, including any action points identified during these rituals. Your instructor will act as both a technical advisor and the product owner.

During the last training session (week 15) you will showcase your application to your cohort and other invited guests. You should create a demonstration of your product as well as a short slide-deck detailing your team's journey. The presentation and demonstration should take 10 minutes.

Good luck and happy coding!
